

Maths for ML

lec1: Linear Algebra I: The ML Context .

eg :-

given data

YOE	Salary
1	10K
2	20K
4	40K
3	30K

YOE: 6  $\longrightarrow$  Salary  $\longrightarrow$  60K ✓  
(prediction)

$$\text{Salary} = 10K * \text{YOE}$$

$$\underline{\text{Salary} = 10K + 40E}$$

(a, y)  
(x, y)

$$y = mx + c$$

slope

y-intercept

(viz)

$y = mx + c$  (st line)

$$\text{Salary} = 10K + 40E$$

$$y = mx + c$$

$\downarrow$        $\downarrow$        $\downarrow$   
 $10K$      $40E$      $0$

②

~ 40 variants

Parameters: (features)

① Size

② Weight

③ Appearance

- Color
- Texture
- Shape / design
- ...

<u>Size</u>	<u>Weight</u>	<u>Color</u>	<u>Fish-type</u>
20	10	brown	f1
—	—	—	—
—	—	—	—

Given data

<u>Weight (kg)</u>	<u>Fish-type</u>
10	f1
10.2	f1
9.7	f1
8.4	<u>f1</u>
15	f2
15.4	f2
15.8	f2
16	<u>f2</u>

Unknown  
9.5 kg → f1

20 kg → f2

10.1 kg → f1

# Terminologies

Features  
independent variables

width	Length	weight	Type
—	—	—	—

↳ Data set

# \* Visualization

<u>weight</u>	<u>length</u>	width	Type
			f1
			f2

## \* Process involved in ML Algorithms:-

(1) Data Collection.

(2) Data Visualization

(3) Choose an appropriate geometrical  
structure to separate the classes.

(4) Choosing a "Loss" function  
which helps decide the  
best structure.

(5) Training / Optimization

# \* Co-ordinate Geometry

$$y = mx + c \quad (\text{eqn of a line})$$

Slope  $\rightarrow$   $m$   $\rightarrow$   $y$ -intercept  $\rightarrow$   $c$

$$y_1 = mx_1 + c$$

$$\tan(0^\circ) = 0$$

$$m = \underline{\underline{\tan(\theta)}}$$

$$\tan(90^\circ) = \infty$$

$$-\infty < \tan \theta < \infty$$

$$y = mx + c$$

$$Ax + By + C = 0$$

$$\left[ w_1 x + w_2 y + w_0 = 0 \right] \rightarrow \underline{\underline{ML}}$$

weight

feature

$$\times \boxed{A}x + By + C = 0$$

$$\underline{\underline{y}} = mx + c$$

$$Ax + By + C = 0$$

$$By = -Ax - C$$

$$y = \underbrace{\left( \frac{-A}{B} \right)}_m x - \underbrace{\left( \frac{C}{B} \right)}_c$$

$$\underline{\omega_1 x + \omega_2 y + \omega_0 = 0}$$

$$\omega_2 y = -\omega_1 x - \omega_0$$

$$y = \left( \frac{-\omega_1}{\omega_2} \right) x + \left( \frac{-\omega_0}{\omega_2} \right)$$

$$y = \underline{m} x + \underline{c}$$

$$m = \left( \frac{-\omega_1}{\omega_2} \right) , \quad c = \left( \frac{-\omega_0}{\omega_2} \right)$$

$$L1: y = m_1 x + c_1$$

$$L2: y = m_2 x + c_2$$

$$m_1 = \tan(\underline{\underline{\alpha_1}})$$

$$m_2 = \tan(\alpha_2)$$

## \* Results

①  $\theta_1 = \theta_2$

$m_1 = m_2$

(lines are parallel)

② If lines are perpendicular to each other:

$m_1 * m_2 = -1$

$\underline{w_1 x} + \underline{w_2 y} + w_0 = 0 \rightarrow \underline{\underline{2D \text{ hyperplane}}}$

$$w_1 x_1 + w_2 x_2 + w_3 x_3 + w_0 = 0$$

→ 3D Hyperplane.

$$w_1 x_1 + w_2 x_2 + w_3 x_3 + w_4 x_4 + w_0 = 0$$
